

July 24, 2019

To our Valued Partners,

We are excited to announce that, as part of our commitment to growth and innovation, we have upgraded the equipment used to process our BeastWire posts. This new automation will not only shorten our production time but will improve the precision of the hole location and size designed to accept our current carriage bolts.

When we launched BeastWire in 2016, we implemented the use of an extruded nylon adapter to seat the square head of the carriage bolt and prevent it from spinning when installed with an impact driver. As a result of our new advancement, there is no longer a need for the carriage bolt adapter. There will be one less piece of hardware needed to connect panels, hinge assemblies, and slide door track brackets to our posts, which we believe will simplify and reduce your installation time.

Beginning August 1, 2019, we will no longer send the carriage bolt adapters as a standard hardware offering. If you feel that you would still like to use them as part of your installation process or to match the look of existing product, we are happy to provide you with a quotation so that you can include it as part of your order. Please make sure that your installers or customers pay attention to the installation instructions that we provide with every project, but particularly during this transition.

In everything that we do, we intend to continue to innovate our BeastWire products to give you the highest quality product and industry-leading service all at a competitive price.

Thank you for your continued support,

Scott Jump
B.E.A.S.T. Agent, and Manager of Innovative Solutions
